SUMMARY

Senior backend engineer with 7+ years of experience building .NET/C# services, SQL-backed systems, and API integrations in a distributed, multi-service platform. Strong track record planning cross-service changes, improving performance, automating manual workflows, debugging hard-to-reproduce production issues, and delivering systems used by enterprise clients.

PROFESSIONAL EXPERIENCE

Syndigo — Chicago, IL — Remote
Software Engineer II — Jan 2021 – present

- **Streamlined new-client onboarding by designing and building a configurable catalog-import pipeline** for Walmart and Amazon selling-partner integrations that pulls a supplier's live retailer listings and syncs them into the platform.
- **Assumed interim technical leadership responsibilities for the data quality platform** during a period of organizational transition, breaking down the plan for its next iteration into actionable engineering tasks while the principal engineer was on extended leave.
- **Reduced client configuration wait times from two weeks to ten minutes, and automated more than 50% of a five-engineer team's manual workload** through redesign of configuration models and creation of a self-service platform for configuration generation, validation, and delivery.
- **Enabled onboarding and implementation for five medical device suppliers** by building backend data transformation and delivery pipelines that matched client device attributes to regulator-defined schemas.
- **Revamped our primary product-ingestion workflow** by resolving two long-standing sources of support escalations: made a high-volume stored procedure ten times faster, eliminating recurring SQL timeouts, and eliminated a race condition disrupting roughly 1% of workflows application-wide by re-sequencing two concurrent processes.
- **Ensured production releases stayed on schedule** by consistently resolving release-blocking issues within a quick turnaround.

Fast Enterprises — Denver, CO
Software Consultant — January 2019 – November 2020

- **Developed and maintained backend software for a statewide driver services and motor vehicle system**, used by state employees in revenue offices across the state to process licensing, titling, and registration transactions.
- **Built and optimized SQL stored procedures** supporting operational reporting and business-critical analysis for client stakeholders.
- **Translated complex business requirements into production software** by defining expected behavior, implementing backend functionality, and validating outcomes with stakeholders.

EDUCATION

Whitworth University — Spokane, WA
B.S., Computer Science

SKILLS

Languages: C#, SQL, T-SQL, VB.NET, Java, Python, Ruby, JavaScript
Frameworks & Platforms: .NET, SQL Server, Ruby on Rails, Azure, AWS
